

New from ARI:

Self acting control valve for Cooling, Mixing and Diverting Systems!

TEMPTROL®

Temperature control without auxiliary power.
Economically – Maintenance Free – Safe

NEW
from ARI!

NEW
from ARI!

Thermal-closing valve

Thermal-opening valve

Thermal-mixing / diverting valve

Technology for the future.
GERMAN QUALITY VALVES

TEMPTROL®

**Reliable control of your systems temperature
of liquids, air and steam – without auxiliary power!**

Thermal-closing valve (for heating systems)
closes with rising temperature

Thermal-opening valve (for cooling systems)
opens with rising temperature

Thermal mixing and diverting valve
Reduces or closes inlet B with rising temperature

LC-Versions

Version LC – without balancing bellows

Version LCG – threaded connection, brass, EPDM/FPM

Approval Germanischer Lloyd

TÜV-approved acc. DIN EN 14597
Reg.-Nr. VDTÜV TR910 & TW911

Temperature regulator
 DN 15 - 100

Features:

- Self-operating (no auxiliary power required)
- Reliable, low maintenance operation
- Over-temperature safety device
- Valves pressure balanced with stainless steel bellows
- 3 thermal controller sizes for optimal selection of proportional range
- Thermal sensors with different time constants
- Exact and easy adjustment
- Setting range is adjustable
- Sensor pocket
- Manual control device

Thermal-closing valve - straight through with flanges

Information / restriction of technical rules need to be observed!

Operating and installation instructions can be downloaded at www.ari-armaturen.com.

ARI-Valves of EN-JL1040 are not allowed to be operated in systems acc. to TRD 110.

A production permission acc. to TRB 801 No. 45 is available (acc. to TRB 801 No. 45 EN-JL1040 is not allowed.)

The engineer, designing a system or a plant, is responsible for the selection of the correct valve.

Resistance and fitness must be verified (contact manufacturer for information, refer to Product overview and Resistance list).

Information / restriction of technical rules need to be observed!

Operating and installation instructions can be downloaded at www.ari-armaturen.com.

A production permission acc. to TRB 801 No. 45 is available.

The engineer, designing a system or a plant, is responsible for the selection of the correct valve.

Resistance and fitness must be verified (contact manufacturer for information, refer to Product overview and Resistance list).

Application / Operating principle

Thermal control devices are used to regulate temperature of fluids, air and steam. You will find them in industrial heating and ventilation systems, in residential applications, in marked-warehouses, ship building and also in cooling systems.

The ARI-Temperature Regulator (TEMPROL) works on the principle of thermal expansion. For operation no extra energy is needed, self acting. Changes in temperature lead to changes in fluid volume in the capillary tube, which means a certain stroke in the actuator onto the valve spindle. The excess temperature protector prevents an unnecessary load on the controller when the temperature is too high on the thermal sensor. The setting range can be adjusted precisely with the adjusting knob to the required temperature value. If a manual control device is fitted, the stroke position is shown and the valve can be operated manually. With thermal detectors acc. to DIN EN 14597, the intended value can only be adjusted with tools.

Ambient temperature: max. 70°C for indicator unit (DIN EN 14597 T70)

Operating principle:	
Thermal closing valve:	- closes with rising temperature
Thermal opening valve:	- opens with rising temperature
Thermo-3-way mixing valve:	- reduces or closes inlet B with rising temperature (at mixing function, the warmer medium must be put into inlet B)
Thermo-3-way diverting valve:	- reduces or closes inlet B with rising temperature

Selecting the valve

To select the nominal diameter it is necessary to know the Kvs-value.

This can be done using the calculation program „MyValve“ (Module „ARI-Temperature regulator TEMPTROL-Calculation“).

The following data is needed

- Medium
- Temperature
- Flow capacity (Q)
- Upstream pressure (p1)
- Downstream pressure (p2)

Then the thermal controller with the next highest Kvs-value is selected (see table). With „MyValve“ you can also calculate the velocities in the piping, before and behind the valve, and if necessary select the right piping size.

For selecting a valve, the pressure-temperature-ratings must be observed (see page 15), also the corrosive aspect.

Selecting the controller

The following must be observed:

- Type selecting acc. to the used medium
(rod sensor, spiral sensor for gas, spiral sensor for liquids, with thread or flange).
- The temperature range.
- Installation place of thermal sensor, set point adjusting unit and valve (length of capillary tubes).

Then the thermal controller is selected using the recommended proportional range (see page 17).

The proportional range shows by which temperature alteration on the thermal sensor, the valve needs from open to closed position. Preferably use the range between 10 and 15 K. It is also possible to use the other ranges, if the calculation of the control loop finds this necessary. We strongly advise that you check the systems transient response.

¹⁾ The proportional range determines at what change in sensor temperature the valve will move from totally open to totally closed.

Setting diagrams

(only for temperature regulators with two temperature sensors and trend scale)

Please indicate when ordering:

- Thermal controller / detector (Type-No.)
- Temperature range
- Length of capillary tube (refer to page 19: L1 ... L4)
- Top mounted handwheel
- Sensor pocket

Please indicate in your order, if the valves are to be installed in hazardous areas (ATEX)

Example:

Manual control device Type 9900390011

- Installed as an accessory between controller and valve.
- Allows valve to be operated independently of the controller.
- Valve position indicator (pin) plus two movable wire set rings mark the max. positions (totally open and totally closed) (Pos. 60.3).
- Enables a pressure relief of the actuator
- Allows a minimum flow for the thermal opening valve (Fig. 775)

Function:

The spindle of the manual control device transfers the travel of the actuator onto the valve. The valve and manual control device is sealed metal to metal. The spindle is sealed with an o-ring and PTFE-strip band.
